

Direct-acting, pressure reducing/relieving main stage piloted from port 4 CAPACITY: 10 gpm / CAVITY: T-21A

sunhydraulics.com/model/PSDT

The direct-acting reducer/reliever main section is meant to act as an interface between a low flow pressure source at port 4 and a circuit with higher flow requirements. The valve will reduce a high primary pressure at the inlet (port 2) to a reduced pressure at port 1, with a full-flow relief function from port 1 to tank (port 3). The valve incorporates a damped construction for stable operation allowing the use of high reduced pressure.
